Parking lot USB exercise

Contents	The USB has personal and work files. It contains family photos, pet photos, a new hire letter, and an employee work schedule. Yes, it may contain PII and sensitive work information, so it is not safe to keep personal and work files together.
Attacker mindset	An attacker could use the information to trick Jorge, his family, or other employees with phishing or scams. The USB could also be left on purpose to make someone plug it into a work computer, giving the attacker access to the hospital's network.
Risk analysis	A USB drive could hide malware, ransomware, or spyware that can infect a computer when it is plugged in. If another employee used the USB, the malware could spread through the hospital's network and steal or damage data. The hospital should train employees not to use unknown USB drives, scan approved USB devices, and block unauthorized USB devices with security software. These controls help protect both employees and the organization from attacks.
